

## ABSTRACT

A novel system and method is herein described for creating user interfaces for a plurality of users of an office land mobile network (OLMN), said system and  
5 method comprising means and steps for receiving a request from said user for service from said OLMN, said request comprising data pertaining to said service; validating said data received from said request; if said data is valid for said request, formatting said data into an internal format; submitting said formatted request to an appropriate framework for application processing; and returning a user interface, said user  
10 interface being appropriate for the particular request received.
